

Outcomes for equitable decision-making

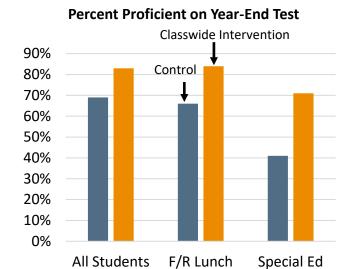

Dr. VanDerHeyden directed a districtwide randomized controlled trial with fourthand fifth-grade students in 2012 to examine the effects of classwide intervention.

This study found:

- Strong gains on CBMs and moderate to strong gains on the year-end test scores at grade four.
- Gains were stronger for students who had greater risk at baseline and integrity accounted for treatment outcomes in the treatment groups.

All	Title	Study	Study Type	<u>Participants</u>	<u>Design</u>	Fidelity of Impl.	Measures (Targeted)	Measures (Broader)
	Spring Math	VanDerHeyden, Martin, & Perrault (2016)	Group Design		—			
	Spring Math	VanDerHeyden, McLaughlin, Algina, & Snyder (2012)	Group Design					

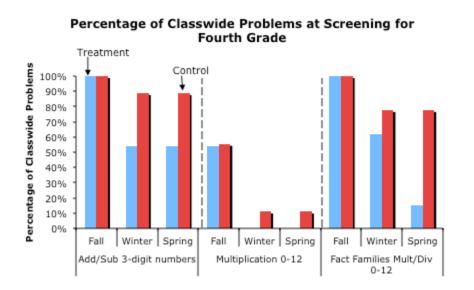

Median ES = .68 CBMs

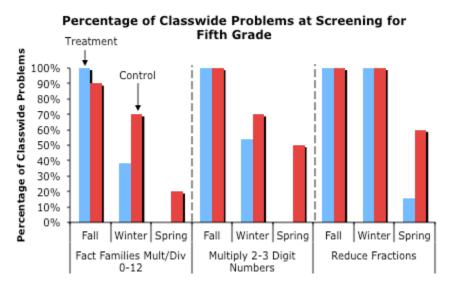

ES = .18 Gr 4

ES = .66 for at-risk Gr 4

ES = .29 Number & Ops Gr 4

ES = 1.00 Number & Ops Gr 4

In a secondary analysis of the RCT data from the 2012 study, VanDerHeyden and Codding (2015) examined the intervention effects on risk reduction and equity in the fourth-grade sample.

They found:

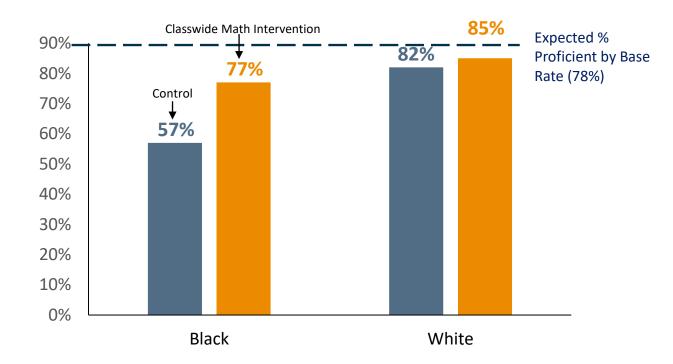

- Very strong risk reduction for all students and especially pronounced risk reduction where risk was elevated at baseline
- For every 7 students who participated in classwide intervention, 1 of those students was prevented from failing the year-end test of math.
- For students who scored below the 25th percentile on the preceding year-end test, the number needed to treat was 2, meaning for every two students who scored below the 25th percentile on the preceding year-end test and received classwide math intervention in the current year, one of those students was prevented from failing the current-year's test.

	Absolute Risk Reduction	Number Needed to Treat	
All students	15%	7	
Students receiving Free/Reduced Lunch	18%	6	
Students receiving Special Education Services	39%	3	
Low-performing Students	44%	2	

- Strong equity effects were also found, favoring intervention
- Achievement was disproportionate by race at baseline
- In the intervention classes, achievement was proportionate by race following intervention
- In the control classes, achievement remained disproportionate by race, with Black students performing much lower than white students
- Important, because race was comparably disproportionate in both control and intervention classrooms before intervention, this study provided experimental evidence that intervention produces equitable achievement

Percent
Proficient
by Race
in Control &
Intervention
Groups

- The SpringMath fall and winter screenings, and classwide intervention response data have been examined for bias and submitted to the NCII Tool's Chart.
- A series of binary logistic regression analyses were conducted for subgroups.
 Scoring below 20th percentile on AZ yearend test was the outcome criterion.
- Interaction terms were tested for each subgroup & screening scores for fall, winter, and classwide intervention.

- None of the interaction terms were significant at any grade level for sex, race, free or reduced lunch status, or special education status.
- These findings replicate all the earlier studies demonstrating screening and intervention is a more equitable basis for determining risk than teacher referral and other forms of assessment (i.e., year-end tests) alone.
